

FIRE-RATED DOORS

FOR RESIDENTIAL & LIGHT COMMERCIAL USE

RF31S

Do you need a Fire-Rated Door?

When considering a fire door, it is crucial to determine if the door is for a Light Commercial or Residential application. Both applications require different doors, and it is vital to choose the correct one for your needs. The products in this catalog are best for multi-family homes, condominiums, apartment buildings, and homes that need a fire-rated entry based on local building codes.

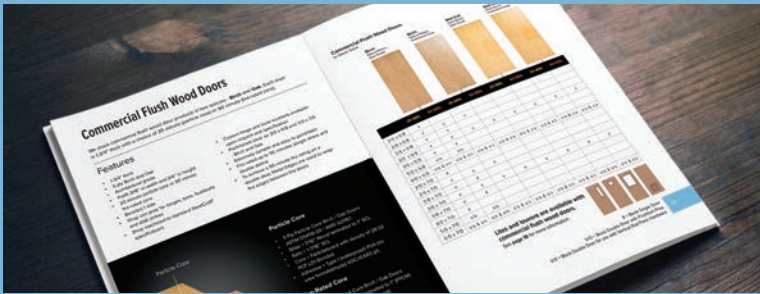

NOTE: It is essential to review and verify the appropriate building codes in your area. Laws and regulations vary widely between states, cities, townships, and municipalities. Always check with all regulating authorities to ensure the door unit you order and install complies with all applicable laws.

Table of Contents

- 90-Minute vs. 20-Minute Units 3

True Commercial Doors

Commercial doors are best suited for doctor's offices, banks, and small office buildings. Made of hollow metal, they can have a 90-minute rating. Check out our in-stock Commercial catalog to learn more at reeb.com/catalogs

90-Minute vs. 20-Minute Units

Choosing a door's rating is important, but the unit's rating is dependent on all the components used. The lowest rated item in the entire unit determines the rating. For example, a 90-minute rated door placed in a 20-minute rated frame has a 20-minute rating.

90-Minute Units

A 90-minute unit is created with a steel-edge door and split steel frame. The Reeb Specialty Products steel-edge doors have an entire steel edge creating a sturdier steel door. These doors are insulated with a polyurethane core and tested to withstand at least 90 minutes of fire exposure. The RSP split steel frame accompanies this door to create a 90-minute unit.

20-Minute Units

There are a few ways to create a 20-minute unit. The RSP steel-edge doors can pair with a 20-minute wood or composite frame. The same 20-minute frame can pair with wood-edge doors. The Therma-Tru wood-edge doors have a polyurethane core for insulation. These fiberglass and steel doors were tested to withstand at least 20-minutes of fire exposure. The 20-minute Therma-Tru doors can also pair with the 90-minute RSP split steel frame for easy installation based on the application need.

Every door needs a lock to keep it closed. Commercial hardware, such as the Hager locksets found in our Commercial Catalog, can also be used on our Residential Fire Doors.

RF11S

Our Reeb Specialty Products (RSP) brand offers high quality products with big savings. The quality of the products provided under the RSP brand are competitive with other major brands within our industry.

Reeb Specialty Products – providing value pricing on quality products.

Neutral and Positive Pressure

The Underwriters Laboratory (UL) and Warnock Hersey (Intertek Testing Services) are the entities that test and rate all fire doors. To properly rate the door, it must be tested as a complete unit with hardware and installed on a wall with a test environment behind it. The primary purpose of the test is to ensure the door can contain the spread of the fire.

Neutral Pressure

Neutral pressure assumes the pressure plane to be above the top of the door, and the pressure will not build up in the room containing the fire. Air flows into the room at the bottom and top of the door preventing flames from spreading. A weatherstrip helps to eliminate the smoke leaving the room.

Positive Pressure

Positive pressure assumes the pressure plane is 40" from the bottom of the door. A neutral pressure area is below the pressure plane, and a positive pressure area is above the plane. Air flows into the room at the bottom but flows out at the top. Along with the circulating air, dangerous gases or flames may also escape causing the door's face to burn.

Reinforced Doors

Steel-edge doors with a bore may also need a door closer, while doors with no bore will need panic hardware.

Additional reinforcements are necessary to ensure the door will stand up to continual usage. A reinforced door includes additional material on the back of the door skin for extra protection.

Door is Reinforced for a Closer and Panic Hardware

Rough Openings

Reeb® Specialty Products Series Fire Doors

Rough openings vary depending on the sill type and the door width. Sill options include a standard sill, no sill, and a public access (ADA) sill for both inswing and outswing units. Ensure the closure package jamb depth and sill application match what is needed in the field. Below are the minimum drywall rough openings. For 7' doors, add 4" to the height dimensions and for 8' doors, add 16" to the height dimension.

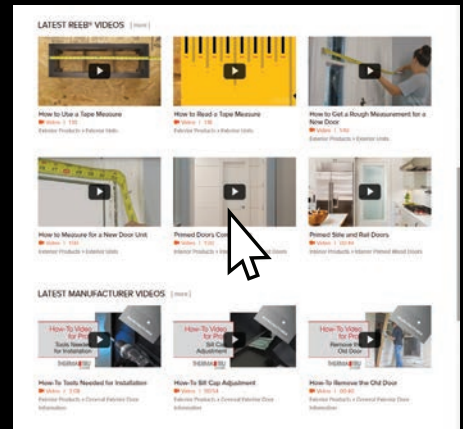

Size	Standard Sill	No Sill	ADA Sill
2668	31-1/8" x 81-21/32"	31-1/8" x 80-13/32"	N/A
2868	33-1/8" x 81-21/32"	33-1/8" x 80-13/32"	N/A
21068	35-1/8" x 81-21/32"	35-1/8" x 80-13/32"	35-1/8" x 80-29/32"
3068	37-1/8" x 81-21/32"	37-1/8" x 80-13/32"	37-1/8" x 80-29/32"
